Ocean of Real World Data

World Model

[[Enter the Engine](#)]

The Physics Gap

LLMs have the internet. Robotics has a void. The leap from silicon to the street isn't solved by more compute—it's solved by **Physical Intelligence**.

OceanVeo is the foundational data layer for the next era of autonomy. We provide the massive-scale, high-fidelity video trajectories required to ground neural networks in the laws of physics.

Engineered for Autonomy

Unfiltered Reality Synthetic data is a hall of mirrors. We supply the high-entropy, real-world diversity that simulation can't replicate. From the chaos of urban density to the nuance of tactile manipulation.

Neural-Ready Pipelines We don't just ship frames; we ship trajectories. Our data is architected for the modern ML stack: automated labeling, dense spatial grounding, and reward-optimized sequences.

Global Coverage Spatial intelligence is a global problem. Our engine operates across four continents, capturing the long-tail edge cases that determine whether a model ships or fails.

The Stack

- **VLA-Ready:** Datasets optimized for Vision-Language-Action models.
 - **Temporal Fidelity:** High-speed captures designed for 4D world modeling.
 - **Egocentric Focus:** Data from the robot's-eye-view, because perspective is everything.
-

Move beyond the lab.

The future is embodied. Give your models a world to learn from.
